
Canonical-v2 seeded-v1 validation summaries. Each pair of bars is the same model at the early vs late generation coordinate (layer 20, mean of prefixes 8/12/16/24).
Lower is better for metric depth, instance identity, and out-of-view object localization; higher is better for view consistency. MiniMax-H3 zero-valued depth and instance identity summaries at layers 20/25 are excluded.
Bottom grid: E/L/= for each layer–prefix pair. CogVideoX and MiniMax-H3 localization do not change.
